[YOUR NAME]

Oracle APEX Application Developer

Custom internal tools, dashboards & client portals — built on your existing Oracle database, delivered in weeks not months.

SAMPLE APPLICATION TEMPLATES

Below are five ready-made application types I build for clients on Oracle APEX. Each can be themed to your brand and delivered as a working prototype for review before any commitment.

1. Approval Workflow

Purchase orders, expenses, leave requests

Replace email chains and paper sign-offs with a structured queue: requests route to the right approver, show status at a glance, and log every decision automatically.

- Configurable approval routing and dollar thresholds
- Real-time status badges (Pending / Approved / Rejected)
- Full audit trail for compliance and finance review

2. Inventory / Asset Tracker

Stock levels, reorder points, locations

A live view of what's on hand, where it sits, and what needs reordering — replacing manual Excel logs that go stale the moment someone forgets to update them.

- Automatic low-stock and out-of-stock flags
- Search, filter, and bin-location lookup
- Exportable reports for procurement and audits

3. Executive Dashboard

KPIs, trends, regional performance

Pull numbers directly from your existing Oracle data into a single screen leadership can check every morning — no more static Friday reports.

- Revenue, order, and fulfillment KPIs in one view
- Trend and regional breakdown charts
- Shareable, always-current — no manual refresh

4. Helpdesk / Ticketing System

IT, facilities, or customer support

A lightweight ticketing board so requests don't get lost in email or Slack — with priority, ownership, and status visible to the whole team.

- Kanban-style board: New, In Progress, Waiting, Resolved
- Priority tagging and assignment
- Ticket history for recurring-issue tracking

5. Client Self-Service Portal

Order tracking, invoices, documents

Give your customers their own login to check order status and invoices themselves — fewer status-check calls and emails for your team to handle.

- Live order tracking with delivery stage indicators
- Invoice and document access
- Built-in support request submission

Want to see one of these live?

I'll build a free working prototype of any app above, themed to your data, so you can see it before spending anything. Typical turnaround: 2–4 weeks from kickoff to working app.
